Volume 1: Proposal Cover Sheet Draft

Use this document as a quick reference sheet while filling out the electronic forms (e-forms) for Volume 1 in the DSIP submission portal.

Section 1: Proposal General Information

DSIP Portal Field	Value to Enter
Solicitation Number	DoD 2026.B (or active Navy solicitation cycle)
Topic Number	DON26BZ01-NV023
Topic Title	Risk-Aware Regenerative AI-based Multimodal Visual-Tactical (ISRT) (Observant-AI) – Monitor, Understand, Alert, and Assist
Proposal Title	Observant-SOL
Phase	Phase I
Proposal Number (DSIP)	*Auto-generated by portal*

Section 2: Company Identifiers & Demographics

DSIP Portal Field	Value to Enter
Legal Business Name	Techman Studios
DBA / Trade Name	*Leave blank / None*
Entity Type	LLC
Year Founded	2022
State of Incorporation	Alabama
UEI (Unique Entity Identifier)	MTXPXGQWBWW5
CAGE Code	8X4K7
SAM.gov Status	Active (Expiration Date: 04/17/2027)
Primary NAICS Code	541511 (Custom Computer Programming Services) or 518210
EIN / TIN	*Enter your company tax ID privately*
Physical Address	2987 Gladden Ln W. Alexandria, AL 36250
Mailing Address	3375 NW 29th Pl. Jennings, FL 32053
Company Website	https://www.techmanstudios.com/
Main Company Phone	256-689-6804
Number of Employees	*Enter current company head count (SBA limit: < 500)*

Section 3: Personnel & Contacts

Corporate Official (CO) / Signatory Authority

- **Name**: Mr. Bryan Tucker
- **Title**: CEO
- **Email**: techman@techmanstudios.com
- **Phone**: 256-689-6804

Technical Point of Contact (TPOC) / Principal Investigator (PI)

- **Name**: Mr. Bryan Tucker
- **Title**: Founder & Lead AI Systems Engineer
- **Email**: techmandesign@gmail.com
- **Phone**: 256-689-6804

Administrative/Business Contact

- **Name**: Mr. Bryan Tucker
- **Title**: CEO
- **Email**: techman@techmanstudios.com
- **Phone**: 256-689-6804

Section 4: Disclosures & Certifications Questionnaire

Portal Question / Field	Response to Select/Enter
SBC Certifications / Status	Select all that apply: • Veteran-Owned Small Business (VOSB) • Service-Disabled Veteran-Owned Small Business (SDVOSB) • Self-Certified Small Disadvantaged Business (SDB)
Primary Place of Performance	Alexandria, Calhoun County, Alabama 36250
Perform Work outside the US?	No
Proposing Subcontractors?	No
Proposing Consultants?	No
Proposed SBC Work Share (%)	100% (SBC requirement is $\ge$ 66.7%)
Foreign Citizens Performing Work?	No
Prior, Current, or Pending Support?	No
Does Proposal Contain Proprietary Info?	Yes *(Note: Abstract and Benefits below are public/non-proprietary; proprietary info is only inside Volume 2)*
Requesting TABA Funds?	No
TABA Dollar Amount	$0.00

Section 5: Technical Abstract (Public Release)

Copy/paste the text below into the DSIP "Technical Abstract" text box. This text is non-proprietary and is approved for public release.

FrontierGrid-Observant is an unclassified Phase I feasibility testbed for risk-aware regenerative AI-based multimodal visual-tactical monitoring, understanding, alerting, and assistance. Naval mission environments produce fragmented, time-sensitive data across sensors, operators, networks, documents, and autonomous systems. Existing centralized AI orchestration can become brittle when events are incomplete, contradictory, degraded, delayed, or distributed across domains.

Techman Studios proposes to investigate a federated contextual-state approach that adapts prior SOL, Frontier_OS, and Exciton-MoA research into an Observant-AI-style prototype. The Phase I effort will build at least three synthetic cross-domain challenge problems, a common event schema, lightweight mission-focused agent roles, a deterministic fallback reasoning substrate, risk scoring and escalation controls, replayable explanations, and a test-and-evaluation harness. The current testbed includes five synthetic scenarios whose anomaly evidence rotates across Sea, Space, Air, Land, and Cyber style domains, including an unknown-unknown injection case that introduces a weak-signal disturbance into the continuous state-space stream. The prototype will compare shared-context behavior against rule-based and centralized baselines using sensitivity, specificity, precision, miss rate, false discovery rate, false omission rate, analytic completeness, uniqueness, validity, consistency, accuracy under noisy data, context-geodesic alignment, active-domain coverage, contribution balance, and candidate-team completeness.

The expected result is a controlled feasibility demonstration showing whether multi-agent contextual fusion can improve risk-aware alerting and source-grounded explanation without requiring classified data in Phase I. Dual-use applications include maritime logistics anomaly detection, critical infrastructure monitoring, emergency response situational awareness, and enterprise risk intelligence.

Section 6: Anticipated Benefits & Commercialization (Public Release)

Copy/paste the text below into the DSIP "Anticipated Benefits" text box. This text is non-proprietary and is approved for public release.

Naval Benefits: The primary benefit to the Navy is earlier warning and reduced false-discovery rates when dealing with ambiguous cross-domain event clusters (such as maritime shadowing or littoral navigational hazards). By structuring event interpretation on a shared contextual state-space, the system separates event risk from data-quality risk, provides explicit skeptic-agent reviews, and produces source-grounded natural-language explanations. This reduces operator cognitive load and enhances trust during degraded communication states or decoy behaviors.

Technical Benefits: The prototype implements a modular adapter-first architecture that keeps a deterministic baseline active while allowing controlled experiments with native manifold-based agent coordination. It provides standard JSON schemas for multi-modal track, network, weather, and text inputs, paired with a reproducible testing and evaluation metrics sweep.

Dual-Use Commercial Applications: Commercial applications include critical infrastructure monitoring, maritime cargo/logistics risk analysis, emergency management situational awareness, and enterprise operations monitoring. These commercial sectors face similar challenges: sparse observations, delayed report streams, conflicting source reliability, and a critical need for explainable escalation over black-box scoring.
